

Key Concepts

- Add raw data sets to the Data Sets Tree (bottom-left), or, add pre-calculated data to existing visualizations (see Workflow).
- The Data Sets Tree contains sets of one or more variables (*variable sets*); the *structure* of a variable set determines how it is analyzed.
- Create tables and other analyses using options in Ribbon > Insert or by dragging data from the Data Sets Tree
 (bottom-left) onto the page.
- Press Ribbon > Home > New Page to create new pages. Drag and drop pages to organize documents. Folders are
 created by dragging pages onto other pages.
- Pages and other objects can be hidden from exports by clicking Ribbon > Appearance > Hide.
- Arbitrary calculations are performed using Ribbon > Insert > R Outputs (see Extracting results from tables using R Outputs).
- Modify objects by clicking on them and either
 - Directly manipulating them (e.g., moving or resizing them).
 - o Modifying more commonly used options in the Ribbon (top of the screen).
 - o Modifying options in the **Object Inspector** (right-side of the screen).
- Trace any calculation back to the original data by hovering over the data input and pressing the [●] that appears in the preview window.
- Use Ribbon > Export to publish the document as a web page, PDF, PowerPoint, or Excel file.

1. Plan your dashboard

Create a detailed plan for the dashboard (e.g., in PowerPoint). It should show all the pages you want to create and the layout on each of those pages.

2. Design and layout

(Optional) Get a graphic artist to create a color palette, style guide, and images as PNGs and JPEGs <u>Dashboard Design: Working with a Graphic Designer</u>

(Optional) Perform more advanced customizations using via the CSS Customizing Logos, Icons, CSS, HTML Headers, and Language in Displayr

3. Create a document

<u>Log in to Displayr</u> and click + Add Document (If using in conjunction with Q, see <u>Using Q Projects in Displayr</u>)
Add and modify text, shapes and images: <u>Ribbon > Insert > Text and images</u> and <u>Appearance</u>
Create folders by dragging pages on top of other pages

4. Hook up visualizations to data: there are four flows

Flow A: Type in data

- Ribbon > Insert > Visualization
- Object Inspector > Properties > DATA SOURCE > Paste or type data

Flow B: Insert Pre-Calculated Tables

- Ribbon > Insert > Paste Table
- Extract results from tables using R Outputs
- Ribbon > Insert > Visualization
- Object Inspector > Properties > DATA SOURCE: Outputs in 'Pages'

Flow C: Analyze imported data sets (raw data)

- · + Add a data set
- Create a table (Tables)
- Extract results from tables using R Outputs
- Ribbon > Insert > Visualization
- Object Inspector >
 Properties > DATA

 SOURCE: Outputs in 'Pages' or Variables in 'Data'

Flow D: Live updating

Either Flow B or Flow C, except with Updating with Revised Data

5. Duplicate

Create something, and press **Home > Duplicate**, and modify the input data. You can apply this to everything from a text box through to a whole report.

6. Export

Ribbon > Export > Excel, PDF, Private Web Page, Public Web Page

When exporting to a web page, the resulting dashboard is seen by the viewer in view mode.

Prevent items from being exported by selecting them and pressing Ribbon > Appearance > Hide

7. Filters for clients

Select the variables(s) in the Data Tree and click Insert > Create Filters from Selected Data

8. Create navigation

Set hyperlinks to text, shapes, images, and charts: Insert > Hyperlink

Hide the navigation bar (pages) from view mode by clicking the bottom of **Export > Private Web Page** and checking **Hide Navigation Pane**

9. User management

Press (top left of Displayr) > Company Settings, press Expand if not already clicked (at bottom) and + New User.

To allocate a license to a user, go to **Licenses** tab and press **Add** (to buy a new license) or **Assign** (to assign an existing license to that user).

To create groups of users (with access to different documents), press ${\color{blue} +}$ New Group

To assign user access to individual document, go to the Documents page, hover over your document and click **Settings**, then go to **Properties** and modify which use groups have access to the document (**Authorized for...**) and individual pages in the document (**Set tab-based access to document**)

10. Updating with revised data

B. Manual A. Manual updating updating of a data of a table/ set visualization Click on the data Click on the set in the table or **Data Sets** visualize-Tree, and ation and click Object press **Update** in Inspector > the Inputs > **Object** DATA SOURCE > Inspector **Edit Data**

Manual codating a table/ sual- action aick on the ble or sualize- ion and ck Object spector > puts > ATA

D. Automatic updating via URL

Data Sets

Tree > + Add a data set > URL > specify Automatically refresh every

E. Automatic updating of R Outputs
Ribbon > Insert > R Output

flipTime::UpdateEvery

Automatically Updating R

Outputs, R Variables, and R

Data Sets

F. Automatic

updating of R

Tree > + Add

a data set > R

Outputs

Data Sets

G. API
If you have programing skills, you can write code to update using the API

Creating Outputs

Tables	Summary tables	Drag dragging from the Data Sets Tree onto the page			
Note that the one of the main ways of modifying a table is to	Crosstabs	Create <i>crosstabs</i> by dragging a variable set from the Data Sets Tree and releasing it on the Columns slot of an existing table			
change the data in the table, and when this is done all other	Duplicate a table	Ribbon > Home > Duplicate			
tables using the same data will also change (see Manipulating	Changing the data	Object Inspector > Inputs > DATA			
ables)	View additional statistics	Object Inspector > Inputs > STATISTICS			
	Multiway table (layers)	Ribbon > More > Tables > Multiway Table			
	Create lots of tables	Ribbon > Insert > Report			
Manipulating tables	Merging categories	Click on the row or column name on a table and drag , or, select all the categories to be merged and press Ribbon > Data Manipulation > Merge			
If a table is created by dragging variables sets from	Creating NETs	Select the categories and press the Ribbon > Data Manipulation > Create NET			
the Data Sets Tree, the categories of the table can be	Sorting/Re-ordering categories	Click on the row or column name on a table and drag , or, Ribbon > Data Manipulation > Sort			
manipulated by dragging and dropping, and the changes apply to all other analyses	Removing a category and/or rebasing	Click on the variable set in the Data Sets Tree and press Object Inspector > Properties > DATA VALUES > Missing values			
based on the variable sets.	Switch between % and averages as main statistics on a table	Click on the variable set in the Data Sets Tree and change the Object Inspector > Properties > INPUTS > Structure (see Variable Set Structures)			
Weights and filters	Create weights from existing variables	Ribbon > Insert > Utilities > Filtering > Create Filters from Selected Data			
Weights and filters can be applied to the entire project or	Use existing variables as filters/weights	Select the variable in the Data Sets Tree and press Object Inspector > Properties > GENERAL > Usable as a filter or Usable as a weight			
to selected tables and plots. Where visualizations and R	Create new weights or filters manually	Ribbon > Insert > New Filter or New Weight			
Outputs are created from tables, weights need to be	Create weights and filters	Weights and filters can be created and applied from the Inputs tab of the Objection .			
applied to the source table.	Create complicated weights and filters	Ribbon > Insert > New R/JavaScript (Variable) > Numeric and press Objectinspector > Properties > GENERAL > Usable as a filter			
	Apply filters and weights to an object	Click on the object: Object Inspector > Inputs > WEIGHTS/FILTERS			
	Show sample size on page	Ribbon > Insert > More (Analysis) > Data > Sample Size Description			
	Linking filters to controls Males V	How to Connect Filters to a Combo Box (Control) Combo Boxes (Controls) With Dynamic Lists in Displayr			
	Weights and filters in R Code	The filter variable is called <code>QFilter</code> and the weights can be used as either <code>QPopulationWeight</code> , which contains the raw weight, or <code>QCalibratedWeight</code> , which sums to the effect sample size computed using Kish's approximation			
Extracting results from	Creating an R Output	Ribbon > Insert > R Output			
tables using R Outputs	Finding the name of a table	Click on the table: Object Inspector > Properties > General > Name			
R Outputs are general-purpose outputs, which can contain text, tables, and visualizations. Code is used to determine	Extracting a value from a one- dimensional table	For example, to extract the result for Males from a table containing gender table.Gender["Male"] or, if the males are in the second cell of the table.Gender[2]			
their contents. A common use case for R	Extracting a value from a two- dimensional table	For example, to extract the result for Males aged 35 to 44: table.Gender.by.Age["Male", "35 to 44"]			
Outputs is to contain results from a larger table.	Extracting ranges of data from a table	For example, to extract the result for Males for columns 2 through 4: table.Gender.by.Age["Male", 2:4]			
Variables	Split a variable set into individual variables	Click on the variable set in the Data Sets Tree and press Ribbon > Data Manipulation > Split (Variables)			
Tables, visualizations, and analyses take variables and	Combine individual variables into a variable set	Click on the variables in the Data Sets Tree and press Ribbon > Data Manipulation > Combine (Variables)			
variable sets as inputs. A variable set is a set of one or more variables. Displayr automatically groups	Change the structure of a variable set	Click on the variable set in the Data Sets Tree and press Object Inspector Properties INPUTS > Structure (see Variable Set Structures)			
	Recode the values of a variable set (including missing values)	Click on the variable and review Object Inspector > Properties > VALUES > Labels Values, Missing Values			
variables into variable sets when data sets are imported.	Create a new variable	Ribbon > Insert > New R or New JavaScript			
	Recode into a different variable	Select the original variable and press Ribbon > Home > Duplicate and then see Recode the values of a variable set			
	Banding/categorizing a numeric variable	Ribbon > Insert > New R (Variable) > Numeric Variable with R CODE of cut (VARIABLE.NAME, 2) to create two categories, then set Object Inspector > Properties INPUTS > Structure to Nominal			

DISPLAYR Troubleshooting

- Look around the Ribbon
- Look around the **Object Inspector**: it has multiple tabs and groups to be expanded

- 1 If writing R code, hover your mouse over code to see additional documentation, use google, and read the warnings and errors that appear above the Object Inspector
- ②Click on any errors and warnings in the Pages Tree and the Data Set Tree
- Contact us: support@displayr.com

What to do when the data in a table looks wrong	Check the sample size a table	When you create a table, the sample size is shown at the bottom of the page. Brand attitude SUMMARY sample size = from 180 to 292; total sample size = 327; 147 missing; 95% confidence level		
	Check count and sample size	Object Inspector > Inputs > STATISTICS > Cells > Count or Sample Size		
	Check the variable set structure	Click on the input variables in the Data Sets Tree, and review Object Inspector > Properties > INPUTS > Structure (see Variable Set Structures)		
	Check that the Filter and Weight are correct	Object Inspector > Inputs > FILTERS & WEIGHTS		
	Review the value attributes of the input variable(s)	Click on the variable and review Object Inspector > Properties > VALUES		
	View the raw data	See Viewing raw data		
	Review how the input variables have been constructed	Click on the variable and review its R CODE or JAVASCRIPT CODE in the Object Inspector > Properties		
	If using Q: In Q check that the correct Rules are applied and, try and remove the rules	If a <i>rule</i> has been applied, a pink Rules tab will appear at the bottom of the table. Control when applied using the Apply dropdowns		
	If using Q: In Q, check if empty rows/columns are are hidden (Q users only; in Q)	Check to see if is depressed (this hides empty rows and columns)		

What to do when a visualization looks wrong		Click on the visualization, hover over the data inputs (Object Inspector > Inputs > DATA SOURCE), and click the Oto go to the the input or inputs.		
		Click here	Hover here	
	Check the source data	R outputs in the 'Pages' tree (top-left)	▲ DATA SOURCE	
	Check the source data	table.Age.by.Gender Table Column % Male Female NFT	Output in 'Pages' able.Age.by.Gender DATA MANIPULATION	
			▶ ROW MANIPULATIONS	
		See What to do when the data in a table looks wrong		
	View the data table	Set Object Inspector > Inputs > OUTPUT > Chart type to Table		
	Modify the data manipulation settings	If the data table looks wrong, but the inputs look correct, check the settings in Object Inspector > Inputs > DATA MANIPULATION, ROW MANIPULATION, and COLUMN MANIPULATION		

	Viewing the raw data for multiple variables	Insert > More (Analysis) > Tables > Raw Data and select the Variables and check Automatic
	Seeing raw data for lots of variables in Excel	1. Select the variables in the Variables and Questions tab 2. Right-click: Export variables to Excel 3. In Excel: VIEW > Freeze Panes > Freeze Top Row 4. In Excel: DATA > Filter
Viewing raw data	Viewing the raw data for a variable set	Drag the variable onto the page, and in the Object Inspector set Inputs > DATA > Columns to RAW DATA

Variable Set Structures

When you create a table in Displayr from data stored in a *data set*, the way the table appears is determined by the *structure* of the *variable set* (group of variables). Each variable set is represented as a folder in the Data Sets Tree. Each *structure* is represented by an icon. Structures are set automatically when importing data and can be modified in the Object Inspector.

Struct	ure	Description	Example			
a	Text	A single variable containing text (or, numeric data that is interpreted as text)	What is your name?			
0	Nominal	A single variable that contains unordered, mutually exclusive, and exhaustive categories (i.e., has a nominal measurement scale)	Gender categories: Male, Female, Unknown			
0	Ordinal	A single variable that contains ordered, mutually exclusive, and exhaustive categories (i.e., has an ordinal measurement scale).	Age categories: Under 18, 18 to 24, 25 to 29, 29 to 54, 54 or more			
2	Numeric	A numeric variable (i.e., interval or ratio scale).	The amount of money in a bank account.			
0-0 38	Date /Time	A numeric variable where the values represent times and/or dates. It contains the number of milliseconds since 1/1/1970.	What is your date of birth? / / 19			
a	Text – Multi	A set of related text variables.	First Name, Last Name, and Street Address			
>	Binary – Multi	A set of related nominal variables, where each value only takes two non-missing values (perhaps after merging categories).	Which of the following have you bought in the past week? ☐ Coke ☐ Pepsi ☐ Fanta			
<u>00</u>	Nominal – Multi	Multiple related nominal variables.	Which meal did you eat most recently at			
$\circ \circ$			Brea	akfast Lunch [Dinner	
			McDonald's	· · · ·	O	
			5 5	0 0	0	
			Wendy's	0 0	O	
⊙ ⊙⊙	Ordinal – Multi	A set of related ordinal variables (The icon is the same as for Nominal – Multi.)	Please rate your satisfaction with the following airlines:			
		·	Lo		High	
				0 0	O O	
				o o	ŏ	
2	Number – Multi	A set of related numeric variables measured on the same scale.	Balance of Savings Account, Balance of Credit Card, Balance of Home Loan			
⊌ ⊌ Binary Multi – Grid	where the variables can be ordered in two dimensions.	Which of these brands a ☐ Coke ☐ Pepsi	are cool? □ Fanta			
		Which of these brands are young? ☐ Coke ☐ Pepsi ☐ Fanta				
		Which of these brands a ☐ Coke ☐ Pepsi	are sexy? □ Fanta			
2 2 Number – Grid 2 2	This is a generalization of a Number – Multi, where the variables can be ordered in two dimensions.	In the past month, how	many <i>economy fligh</i>	ots did you take on		
		Qantas UnitedDelta				
			and how many business class flights did you take on			
		Qantas United	Delta			
1 ₂ ³ Ranking		Dool, the fall-order of	.dd: t- t-			
1,3	Ranking	A set of related numeric variables that represent a ranking, where the highest number	Rank the following bran	3	much you like them	
2	is most preferred, and ties are permitted.	Coke Pepsi	_ Fanta			
• •	Binary – Multi (Compact)	The same underlying data as Binary - Multi, except that is stored as a Nominal – Multi and the unique values correspond to underlying binary variables. For example, in data storing people's car model ownership, rather than having a binary variable for each model of car, instead the first variable represents peoples first care, the second variable is for their second car, etc. This format should only be used to represent data where it provides massive data storage gains, as it is generally difficult to manipulate and cannot accommodate the notion of missing data well.				
X Experiment	Experiment	This structure is used to represent the various	Which of these would you buy?			
	types of experiments, from randomized experiments ("Fully randomized experiments"	Coke	Pepsi	Fanta		
		through to "Conjoint Analysis" and "Choice	\$2.00	\$4.20	\$3.20	
	Modeling")	Can	Bottle	Flask
